

Here are some trivial R examples that will help to illustrate how knitr works:

```
z <- 1:10
mean(z)

## [1] 5.5

summary(z)

##      Min. 1st Qu.  Median    Mean 3rd Qu.    Max.
##      1.00   3.25   5.50   5.50   7.75   10.00

z[z > 5]

## [1]  6  7  8  9 10
```

The above text was a code block woven into my description. It gets evaluated and integrated into the output. Cool, eh?
